Microbial Defense Laboratories

Re: N-List Update

LAST™ One Step Disinfectant with Antimicrobial Coating is an EPA Registered Hospital Grade Disinfectant whose ingredients include 4 different Quaternary Disinfectants coupled with the RAZOR Brand Antimicrobial Coating. LAST™ contains more Disinfecting ingredients than most of the Quaternary Disinfectants currently on the N-List.

The EPA has already approved LAST™ as a Fungicide, Virucide and Bactericide.

Some of the Approved Pathogens controlled by LAST™ are: Staphylococcus aureus, Pseudomonas aeruginosa, Salmonella enterica, Methicillin Resistant Staphylococcus aureus (MRSA), Avian Influenza A (H5N1), Trichophyton mentagrophytes and more.

LAST™ is an innovative and newly registered product that required additional testing by the EPA to be added to the N-List.

Lab Results have just been published for Corona Virus. The Non-GLP test results were above the EPA required thresholds showing a kill rate of Corona Virus at 99.9% effective!

MDL is working diligently to add LAST™ to the N-List and will continue to release updates on the progress.

The EPA is currently looking into the use of long-lasting Antimicrobials as a benefit in reducing cross contamination. Recent Independent Laboratory testing has shown great residual efficacy results against the Corona Virus.
